Grüezi and welcome!

An innovative family company since 1934

Within the manufacturing unit in Switzerland, ALESA employs highly motivated, well trained staff, sharing a wealth of experience and knowledge gained within the cutting tool industry. We are proud that we are one of the few remaining family owned businesses within our sector.

At all times we supply market leading products, offer the highest possible technical support, deliver on time at competitive prices. This is achieved via a network of some 60 global distributors ensuring continuity of supply of both products and services.

Precision tool factory

Precision

We specialise in the manufacture of highly positive, sharply ground, precision cutting tools produced from HSS and carbide.

These offer the highest possible performance figures particularly on difficult materials and extraordinary applications.

We can offer engineering solutions to the most demanding machining problems reducing cycle times, vibration and tooling costs whilst improving surface finishes and chip formation. Call us now and realise the potential of ALESA!

indexable inserts is of course also equipped with our highly positive, extremely sharp ground cutting edge. ALESA indexable inserts are available in HSS-E and finest grain metal carbide. Various hard material coatings ensure a long tool life. It goes without saying that almost all our toolholders are prepared for internal coolant supply.

Turning/parting: In this area, too, we have an extensive range of toolholders for external and internal turning with the matching indexable inserts in HSS-E to ISO standard.

Our ALESA GOLD high-precision ISO toolbits and cutting tools are also world-renowned. Similarly, the Minicut and Duocut parting inserts and cutting-off tools in HSS-E are a byword in the trade.

Sawing: The ALESA metal-cutting circular saws in HSS and carbide give

top performance all around. Our circular saws with steam-tempered surface or hard-material coating achieve even better life expectancy.

Nutex: The extraordinary combination of circular saw blade and holder in one tool indicates the system Nutex, Nutex Mini, Nutex Mono and Nutex Plus. With this tool it is possible to machine on CNC centres without fixings protruding out of the tool face.

Custom-made products: If you have any processing problems, we consider it our duty to be able to offer a solution. Our development department welcomes the challenge of producing special tools to individual requirements or customer drawings.

With you as partner we aim to develop visions and pursue new methods.

Metal cutting with creativity

Milling: The ALESA indexable inserts which are developed and patented by us are distinguished by a high-tech cutting geometry and are being used to great success all over the world. The extensive range of ISO standard

Our general delivery and sales conditions apply, see www.alesa.ch

Guide-line for ALESA Catalog

How do I get the best cutting value for my application?

1. Allocation of the materials and material strength - page 140

Based on the materials table on pages 140, the assigned class of the material may be obtained by material number, material grade DIN, Euro standard EN, AFNOR (French Standards), B.S. (British Standard), AISI SAE (USA). This class of materials is for HSS and carbide tools.

In addition, the ultimate tensile strength of the material needs to be retained.

2. Machining method - page 4 (milling)

Choose the appropriate tool from the ALESA catalog according to your machining method, such as plan, profile, or high-feed cutting.

An overview, arranged by application, or machining method respectively, can be found on page 4. If you need assistance, please do not hesitate to contact us.

3. Dimensions of the tool and type of indexable inserts - page 127 and 128

Based on consideration of machine performance, part size, and required cutting depth, select the tool diameter and the size of the inserts.

For the selection of cutting insert quality (cutting geometry and coating), you will find help in the overviews on page 127 and 128 in the catalog.

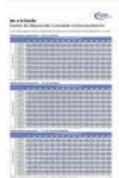

4. Cutting speed v_c - page 137

Based on the material class, the meshing conditions, and the coating the recommended speed can be obtained from the corresponding data table (pages 139 - 141). The resulting tool speed can be calculated with the selected tool diameter (page 136).

Please note the kappa angle.

5. Calculation through average chip thickness «hm» and feed per tooth «fz» - page 130/131

With the permissible «hm» value for the average chip thickness (page 130) and the involvement of «ae in % of the tool diameter,» the feed per tooth can be obtained through the hm-fz table (90°, 45° or 15°) on page 131.

With the available data, the feed rate (Vf) can now be calculated (page 134).

6. Calculation of the chip removal rate «Q» - page 134

The chip removal rate is a reliable factor to be able to compare the effectiveness of the processing.

The chip removal rate is calculated with:

$$Q = \text{cutting depth } «ap» \times \text{width of cut } ae \times \text{feed } «Vf» / 1000$$

This formula also can again be found on page 134.

7. Inspection and process corrections - page 133

After the working process has been started, conclusions about the processing time and tool life can be made. This way the processing cost and tool cost per part can be calculated.

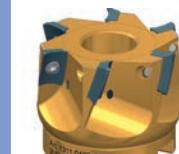

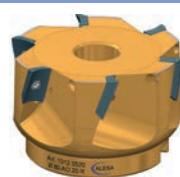

Corrective action according to page 133 can be made with the assessment of wear of the cutting tool.

Basic processing recommendations:

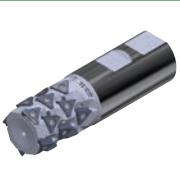

- Tool overhang as long as necessary but as briefly as possible
- Provide stable expansion operations, avoid vibrations
- Radial and axial run-out of the tools according to the manufacturer's instructions
- Large depth of cut, small cutting width (cutting insert length advantage, ae <35%)
- hm values and Vc conditions according to manufacturer
- climb milling cutting only

Profile milling 90°

ALESA Delta

The characteristics

- ... us de Schwiiiz! All milling cutter tools as well as the indexable inserts are designed and manufactured in Switzerland.
- Unique 20° helix angle, this peeling cutting process is very spindle and machine friendly.
- The sharp edges require less spindle power.
- The wedge-shaped positioning of the DELTA indexable inserts into the tool bodies are very process secure. This design allows a repetitively and high accuracy assembly of the indexable inserts.
- The special screws of the Delta inserts have an important function.
- Only when tightened with the correct torque, the screws ensure a process secure positioning of the inserts in the insert pockets.
- The DELTA tools have uneven pitch.
- This feature together with the peeling cutting process and a good balancing are ideal circumstances for milling processes on 5-axes machine centers.
- All DELTA tools made for internal coolant supply, there are holes for each insert pocket and for central coolant supply also.

The benefits and options for you

- TNFU11 for cutting depth (ap) up to 8 mm, TNFU18 ap up to 13 mm.
- The milling cutters TN11 available in Ø 25 mm – Ø 32 mm with Weldon shank or as threaded type version, the milling cutter TN11 Ø 43 mm shell mill.
- The cutters TN18 are shell mills available in Ø 43 mm – Ø 103 mm (125 mm).
- All diameters are available as hob milling cutters also.
- We recommend the PVD coated indexable inserts for the following applications:
 - Carbide CTS with AlCrN-VA for material classification (MC) 4 (NON-ferrous metals) and MC 6 (synthetic materials).
 - In addition we recommend CTS with DLC-H coating especially for cast aluminum and fiber enforced composite materials.
 - Carbide CTS-X / TiNoy for MC 1 (steel), MC 2 (stainless steel) and for Duplex alloys < 800 N/mm².
 - Carbide CTM / TiNoy in den MC 5 (Ni- / Ti- / Co- based alloys) and for Super-Duplex alloys > 800 N/mm²
 - The CTM carbide quality has a very high fracture toughness. We recommend those CTM / TiNoy indexable inserts for rough application in hobbing processes in MC 1 – 3 and MC 5 as alternative to CTS-X.
- Those DELTA indexable inserts allow dry or wet machining.
- NEW DELTA TNFU18 CTS-G with TiNoy-G. We recommend this finest grain carbide quality for fine finishing milling in cast or steel alloys under dry or mist coolant condition. (not suitable for wet machining)
- For special tools, our construction with great experience is available.

Profile milling 90°

ALESA Twist

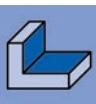

The characteristics

- THE original of the high-positive, sharp-ground indexable inserts milling cutters
- ... us de Schwiez! The milling head and cutting inserts are completely manufactured in Switzerland.
- Unique with 20° helix angle
- The peeling cutting process is very spindle and machine-friendly
- The sharp edges require less spindle power and the cutting forces are much lower
- The ALESA TWIST and DELTA tools are optimized for modern 5-axis milling cutters
- All tools are provided with cooling holes. The cooling medium is exactly there where it is needed
- The best PVD coatings are available
- There are HSS and carbide inserts available from the warehouse with different radii

The benefits and options for you

- Fast delivery from the Seengen warehouse
- There are HSS and carbide inserts available
- From Ø 16 mm to Ø 50 mm on AOFT 10
- From Ø 25 mm to Ø 80 mm on AOFT 15
- From Ø 50 mm to Ø 100 mm on AOFT 20
- From Ø 25 mm to Ø 43 mm on TNFU 11
- From Ø 43 mm to Ø 103 mm on TNFU 18
- Carbide grades are available for dry and wet machining
- HSS is more reliable and powerful for many applications
- High removal rate (Q) with a relatively small machine load
- Good tool life with high productivity
- With the high feed cutting insert type 481/581 it can also be used for 6xD - 10xD tool extensions
- Outstanding machining characteristics, also with the most difficult Ni-, Ti- and Co- alloys
- Manufactured according to ISO certified processes
- For special tools, our construction with great experience is available

ALESA DELTA: the spiral ground indexable insert for a smooth and vibration-free chip removal for any metals.

Highly positive, extremely sharp cutting edge of carbide.

When milling slots with an internal cooling system set operating pressure above 20 bar. Ensure clear chip removal.

ALESA TWIST: the patented spiral ground indexable insert for a smooth and vibration-free chip removal for any metals. The full cutting edge is useable (ap).

The high performance tool with 2 cutting edges allows slot milling in one process step.

Slot milling: for slot depths > 40% ap, use only tools with 2 cutting edges.

Stainless steels (V2A) can be machined dry with AlCrN coated inserts.

ALESA TWIST: the patented spiral ground indexable insert for a smooth and vibration-free chip removal for any metals. The full cutting edge is useable (ap).

Highly positive, extremely sharp cutting edge of HSS-E and carbide.

Stainless steels (V2A) can be machined dry with AlCrN coated inserts.

ALESA TWIST: the patented spiral ground indexable insert for a smooth and vibration-free chip removal for any metals. The full cutting edge is useable (ap).

The high performance tool with 2 cutting edges allows slot milling in one process step.

Slot milling: for slot depths > 40% ap, use only tools with 2 cutting edges.

Stainless steels (V2A) can be machined dry with AlCrN coated inserts.

ALESA TWIST: the patented spiral ground indexable insert for a smooth and vibration-free chip removal for any metals. The full cutting edge is useable (ap).

Highly positive, extremely sharp cutting edge of HSS-E and carbide.

When milling slots with an internal cooling system set operating pressure above 20 bar. Ensure clear chip removal.

Stainless steels (V2A) can be machined dry with AlCrN coated inserts.

1340.0502	63-AO 15 Coolex	63	40	22	11	20	13	✓	6	r	AOFT 15 T3

Tool will be delivered with holder, all screws and screw-driver, but without indexable inserts.

Special spare parts for ALESA TWIST Coolex AO15:

No 1489.0462 Hydroshield / No 1491.0220 Screw M2.5x5 for hydroshield / No 1493.0300 Screw-driver TP 7 IP

How to remove the hydroshield

1. Befestigungsschraube lösen.
2. Hydroschild mit dem Schraubendreher in der abgebildeten Richtung herauskippen.
1. Desserrer la vis de fixation.
2. Soulever le déflecteur périphérique dans la direction indiquée à l'aide du tournevis.
1. Loosen the fixing screw.
2. Pull out the hydroshield with the screwdriver as shown on the picture.

Info	Innovative cooling / lubricating solution over the relieve face. ALESA recommendation for material classification 5 together with "631" inserts. Internal coolant pressure up to 70 bar.	Info	ALESA TWIST: the patented spiral ground indexable insert for a smooth and vibration-free chip removal for any metals. The full cutting edge is useable (ap).	
!	When milling slots with an internal cooling system set operating pressure above 20 bar. Ensure clear chip removal.

Hobbing

ALESA Delta

The characteristics

- THE new original of the high-positive, sharp-ground shell end-indexable insert cutters
- SWISS Precision Tool. The milling head and cutting inserts are manufactured in Switzerland
- Unique with 20° helix angle
- The peeling of the cutting process is very spindle and machine-friendly
- The sharp blades require less spindle power and the cutting forces are much smaller
- The ALESA tools are optimized for modern 5-axis milling centers
- All tools are provided with cooling holes. Optimum cooling, optimal evacuation of chips

The benefits and options for you

- Fast delivery from the Seengen warehouse
- There are different Ø ranges available
- Ø 25 mm and Ø 32 mm Weldon and also with screw head
- Ø 43 mm to Ø 83 mm as arbor milling cutter
- With various cutting-geometries a very large range of materials can be processed
- There are carbide qualities for the dry and wet machining
- High removal rate (Q) and large depth of cut with a relatively small machine load
- Good tool life and high productivity
- Excellent machining properties with the most difficult Ni-, Ti- and Co- alloys
- Manufactured according to ISO certified processes
- For special tools, our construction with great experience is available

Hobbing

ALESA Delta

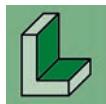

Comments on the application of shell-end mills

- Shell-end mills put heavy demands on spindle performance as well as on the stability of the tool holder and the clamping condition of parts
- Processing with vibration should be avoided
- The unequal division and the special ALESA spiral position of the cutting edges have a large influence on the cutting forces that occur
- Machine-friendly processes without oscillations and vibrations are the rule
- Choose tool holder to be as long as necessary and as short as possible
- In case of extensions, preferably select the tools with Ø 43 mm, Ø 53 mm, Ø 66 mm or Ø 83 mm, so that a potentially larger extension diameter can be used
- Preferably, use accurate holders! Circular and axial run-out errors have a much larger effect with shell end mills than with normal cutting tools
- Shell-end mills produce the best performance if $ae < 20\%$ of the tool diameter is used
- Watch out for adequate and stable pressure coolant supply when using cooling. The cooling demand is much higher than with normal cutting tools
- To tighten the center screw use torque wrenches!

Cutting and process data for shell-end mills

- Cutting speed and average chip thickness hm can be found in the ALESA catalog
- For shell-end mills, the Vc_{max} in the slotting / face milling field « $ae = 50\% - 100\%$ » has to match the class of materials
- Calculate N_{max} and Vf_{max} in advance
- **IMPORTANT:**
If vibrations did occur, check the cutting insert bolts and if necessary tighten them again with the proper torque
- If cutting insert rows are not required, the cutting insert screws must be removed also
- For outer or inner circular processing the correct track speed « Vf » at the center of the milling machine must be calculated
- With outer and inner circular milling, several factors influence the actual cutting width « ae ». The large depth of cut with the shell-end mills causes large radial forces, which can also go up excessively in case of strong increase of the width of the cut:
The actual « ae » must therefore be calculated

Fine finish milling

ALESA Delta adjustable

The characteristics

- Fine finishing tool based on the ALESA DELTA
- SWISS Precision Tool. The milling head and cutting inserts are manufactured in Switzerland
- Brilliantly simple setting system for adjusting the axial run-out
- Each insert can be axially adjusted to 0.001-0.002 mm (1-2 µm) be adjusted
- The fine finishing cutting inserts have a finishing edge
- The spiral angle of 20° means that the tools have a positive axial rake angle
- The sharp cutting produces a very small cutting force Prerequisite for accuracy
- The unequal division is minimizing vibrations
- All tools are provided with cooling holes. During finishing, the cooling affects the surface quality significantly
- Various carbide grades and coatings are available

The benefits and options for you

- Fast delivery from the Seengen warehouse
- Arbor milling cutter Ø 43 mm to Ø 125 mm
- The optimized cutting geometries with fine finishing edge produce surfaces with Ra 0.3 - 0.4 (N5)
- High surface accuracy even when interrupted cutting
- Good tool life and high productivity
- Adjustability of the cutting inserts is also helpful to correct deviations for extensions
- Highest accuracy for guide and support surfaces
- Manufactured according to ISO certified processes
- For special tools, our construction with large experience is available

Fine finish milling

see ALESA
catalog «NUTEX»

ALESA NUTEX Plan

The characteristics

- Fine finishing tool based on the carbide Nutex Plus tool system
- All the teeth are ground in one setting, resulting in high accuracy
- Sharp ground cutting edges, with small cutting forces and good chip formation
- Positive cutting geometry in the axial direction also
- AlCrN PVD coating of the latest technology
- Very stable holders, based on the Nutex Plus System
- Internal coolant supply from both sides

The benefits and options for you

- Fast delivery from the Seengen warehouse
- Level finishing tools are available in the Ø 50 mm Ø 63 mm with a width of 6 mm
- Large numbers of teeth Z=16 and Z=18, relatively high feed rates, short finish times
- Nutex finishing tools can be re-sharpened

ALESA NUTEX Faset

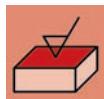

The characteristics

- 45° deburring tool based on the carbide Nutex Mini tool system
- The work of deburring can be improved significantly with the ALESA Nutex Faset

The benefits and options for you

- Fast delivery from the Seengen warehouse
- Two holders are available (M6 and shaft)
- The small prism tool fits the Nutex mini holders
- Available Ø 16 x 4.5 with Z = 10, coating AlCrN
- It can be manufactured up to 2 x 45° chamfering

Assembly and adjustment instructions for Alesa Delta milling head adjustable

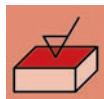

Basically the fine adjustment allows a maximum adjustment of 40 µm! We therefore recommend going back to the basic settings regularly.

Basic setting: (milling head mounted on tool holder)

1. Carefully clean the support and pocket surfaces of the insert and milling head. Lightly grease the screws if necessary.
2. Loosen the adjusting screws (AJS) until the screws can move freely.
3. Mount indexable inserts and tighten the insert screws (INS) with a torque screwdriver T20 with 5Nm.
4. Screw in the AJS with a T9 screwdriver until you feel a slight resistance.
5. Measure and record the height of each insert on the tool presetter.
6. The "basic setting" is only carried out when the INS are released. The highest insert corner is raised by a maximum of 5µm. All other insert corners are adjusted to the same height (within approx. 5µm).
A half ($\frac{1}{2}$) turn of the AJS corresponds to about 10-12µm height adjustment.
Before measuring the height, tighten the INS again with 5Nm.
7. A first cut is milled with this basic setting.
Only then is the fine adjustment made to 1µm - 2µm.
The result can only be achieved if the setting is made directly in the machine spindle. We recommend using a large flat stylus (not a ball).

Fine adjustment: 1µm dial indicator

If the height difference is less than 5 µm, the inserts can be readjusted without loosening the INS. Otherwise the INS must be released. This Step must be carried out individually on each machine spindle.

Face milling 45°

ALESA Hepta

The characteristics

- ... us de Schwiiiz! All milling cutter tools as well as the indexable inserts are designed and manufactured in Switzerland.
- The 45° HEPTA face milling tools are equipped with double sided indexable inserts with total 14 cutting edges (2x7).
- The high amount of cutting edges are a guarantee for an excellent price-performance ratio.
- The sharp ground edges require less spindle power and are process friendly.
- The dovetail shape positioning of the HEPTA indexable inserts into the tool bodies are very process secure.
- The shape of the tool body and the indexable inserts are a unit. The basic design of the indexable inserts protects the cutting edges on the back side while milling.
- The HEPTA tools have straight cutting edges with the effect of exact 45° chamfers.
- Each edge has a ground smooth phase for high quality surfaces.
- The uneven pitch together with the peeling cutting process and a good balancing are ideal circumstances for milling processes on 5-axes machine centers.
- All HEPTA tools are provided with internal holes for coolant supply.
- HEPTA indexable inserts have a large contact area with the tool body. This enables a good heat transfer and thermal stability even under dry machining processes.

The benefits and options for you

- The HEPTA indexable inserts XOFU 06 are for cutting depth (ap) up to 4 mm.
- The milling cutters XO 06 are shell mills available in Ø 40 mm – Ø 160 mm.
- We recommend the PVD coated indexable inserts for following application:
Carbide CTS with AlCrN-VA for material classification (MC) 1 (steel) and MC 3 (cast alloys).
Carbide CTS-X / TiNoy for MC 2 (stainless steel) and MC 5 (Ni- / Ti- / Co-based alloys), for Duplex- and Super-Duplex alloys.
- All HEPTA indexable inserts allow dry or wet machining.
- Based on the design and basic cutting technology, HEPTA tools should NOT be used within ae (radial engagement) range 40% to 60%.
- Best milling results can be achieved in MC 2 & 5 if ae < 35%.
- For special tools, our construction with great experience is available.

Face milling 45°

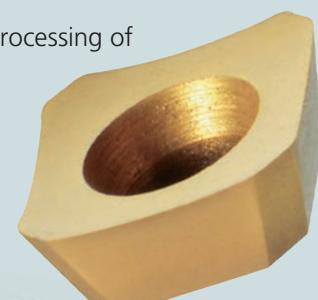

ALESA SD09 / SD12

The characteristics

- THE classic of the 45° face cutting insert tools with SD screw-in cutting inserts
- From ALESA with high positive, sharp-ground inserts
- SWISS Precision Tool. The milling head and cutting inserts are manufactured in Switzerland
- Robust and proven solution according to DIN
- The sharp blades require less spindle power than pure sintered cutting inserts
- The sharp-ground cutting inserts are optimized for modern 5-axis milling centers
- SD tools Ø 16 mm to Ø 100 mm are provided with coolant holes, which enable an inner coolant supply
- The best PVD coatings are available
- HSS and several carbide cutting inserts are available from the warehouse

The benefits and options for you

- Fast delivery from the Seengen warehouse
- Weldon type Ø 16 mm to Ø 40 mm
- Arbor type Ø 40 mm to Ø 160 mm
- With 3 cutting geometries a very large range of materials can be processed
- HSS cutting insert with TiN and TiAlN coatings are safe and efficient for the processing of many applications
- High removal rate (Q) with a relatively small machine load
- Good tool life and high productivity
- The same cutting inserts can also be used on the ALESA SPEED
- The latest developments show excellent cutting processes also with the most difficult Ni-, Ti- and Co- alloys
- Manufactured according to ISO certified processes
- For special tools, our construction with great experience is available

Excellent tool for face milling.

Better surface due to a ground face cutting edge.

Recommended application range: ae < 40% or ae > 60% of the tool diameter.

ap (max) = 3 mm for multipass milling.

When operating circular motion full slot and dip milling ap is max = 3 mm.

Highly positive, extremely sharp cutting edge of HSS-E and carbide.

ALESA tools are distinguished by their very precise concentricity.

High feed milling

ALESA SPEED

The characteristics

- High Performance Cutting for modern 5-axis machines
- SWISS Precision Tool. The milling head and cutting inserts are manufactured in Switzerland
- Kappa angle 15°, high rough performance
- The peeling cutting process is very spindle and machine-friendly
- The sharp edges and the arrangement of the cutting inserts generate spindle-friendly cutting forces, which work mainly axially
- All tools are provided with cooling holes
With center cooling in addition
- The best PVD coatings are available
- HSS and carbide cutting inserts with various cutting geometries available from the warehouse

The benefits and options for you

- Fast delivery from the Seengen warehouse
- The proved and tested SD 09 or SD 12 cutting insert can be used.
4 cutting edges per cutting insert are very effective
- Ø 12 mm to Ø 25 mm are available as Weldon and a screw-in toolholder
- Arbor milling cutters in the range Ø 32 mm to Ø 83 mm
- For the large range of materials, the economical cutting inserts with 3 available cutting geometries can be chosen
- Carbide grades are available for dry and wet processing
Unique to ALESA Ltd., the HSS cutting inserts are also available
- HSS is reliable and efficient with many applications
- Process-safe and high removal rate (Q) with a relatively small machine load
- Good tool life and high productivity
- The high-feed tools are used in applications with large 6xD - 10xD tool extensions
- Suitable for circular plunging into solid material for holes from Ø 27 mm (SD 09) to Ø 206 mm (SD 12)
- Excellent for pockets and free-form shapes
- Excellent machining properties also with the most difficult Duplex, Ni-, and Ti- alloys
- Manufactured according to ISO certified processes
- For special tools, our construction with great experience is available

High feed milling

ALESA TWIST with inserts type 481/681

The characteristics

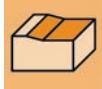

- Additional benefits of the ALESA TWIST tool holder family
- SWISS Precision Tool. The milling head and cutting inserts are manufactured in Switzerland
- In addition to the profile cutting inserts, high feed cutting inserts type 481/681 are also available
- New milling strategy: small cutting depth (ap) and high-tooth feed
- The sharpened cutting edges require less power than pure sintered high-feed cutting inserts
- The small cutting forces cause less vibrations and are spindle-friendly
- The sharp-ground cutting inserts are optimized for modern 5-axis milling centers
- All ALESA TWIST tools are provided with cooling holes. The cooling medium is exactly there where it is needed
- The best PVD coatings are available

The benefits and options for you

- Fast delivery from the Seengen warehouse
- Ø 16 mm to Ø 25 mm as Weldon
- Ø 16 mm to Ø 32 mm screw-in tools
- Arbor milling cutter Ø 32 mm to Ø 50 mm
- Carbide qualities are present for dry and wet machining processes
- High removal rate (Q) with a relatively small machine load and very good process safety
- The high-feed tools are used in applications with large 6xD - 10xD tool extensions
- Suitable for circular plunging into solid material for holes from Ø 19 mm
- Excellent for pockets and free-form shapes
- Good tool life and high productivity
- Excellent metal cutting properties with the most difficult Ni-, Ti- and Co- alloys
- Manufactured according to ISO certified processes
- For special tools, our construction with great experience is available

The flat Kappa angle of around 15° allows a very high feed per tooth.

This tool mainly generates forces in axial direction, which allows big protrudings and preserves the spindle.

Due to the wide range of SD indexable inserts, the entire material range can also be machined with the SPEED milling cutter.

The flat Kappa angle of around 15° allows a very high feed per tooth.

By exchanging the indexable inserts, this milling tool can also be used as a step milling cutter.

This tool mainly generates forces in axial direction, which allows big protrudings and preserves the spindle.

The same TWIST milling bodies as for profile milling 90° can be used with 481/581 inserts.

Milling with button inserts

ALESA RP 12

The characteristics

- THE classic of bolted button insert tools with RP 12 cutting inserts
- High positive ALESA sharp-ground inserts
- SWISS Precision Tool. The milling head and cutting inserts are manufactured in Switzerland
- Robust and proven solution according to DIN
- The sharp edges require less spindle power than pure sintered cutting insert
- The sharp-ground cutting inserts are optimized for modern 5-axis milling centers
- The RP 12 tools Ø 40 mm to Ø100 mm are equipped with cooling holes for internal coolant supply
- The RP 12 tools with Ø 125 mm and Ø 160 mm can be provided with coolant distribution rings, which contain an internal coolant supply
- The best PVD coatings are available
- HSS and carbide cutting inserts are available from the warehouse

The benefits and options for you

- Fast delivery from the Seengen warehouse
- Arbor type from Ø 40 mm to Ø 160 mm
- With 3 cutting geometries a very large range of materials can be processed
- HSS cutting inserts with TiN and TiAlN coatings are safe and efficient for the processing of many applications
- High chip removal rate (Q) with a relatively small machine load
- Good tool life and high productivity
- RP 12 cutting inserts are very efficient for face milling at cutting depths (ap) up to 2 mm
- The latest developments show excellent cutting processes with the most difficult Ni-, Ti- and Co- alloys
- Manufactured according to ISO certified processes
- For special tools, our construction with large experience is available

Milling with button inserts

ALESA RP 06/08/10

ALESA threaded type cutter RP 06/08/10

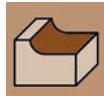

- Like the RP round insert cutter, the threaded type cutters are also available for inserts 06 / 08 and 10
- All ALESA's cutting inserts are high positive and sharp ground
- SWISS Precision Tool. The heads and cutting inserts are manufactured in Switzerland
- The sharp edges create less cutting forces and require less spindle performance than pure sintered cutting inserts
- The sharp ground cutting inserts are optimized for modern 5-axis milling centers
- The RD threaded type cutters are available from the warehouse in Ø 12 mm with RD 06, in Ø 16 mm with RD 08 and in Ø 20 mm with RD 10
- For the carbide RD cutting inserts, different powerful PVD coatings are available
- Fast delivery from the Seengen warehouse
- Manufactured according to ISO certified processes
- For special tools, our construction with great experience is available

ALESA RP 06/08/10

- Based on the classic button inserts, ALESA also delivers RP cutting inserts in sizes 06 / 08 and 10
- All ALESA's cutting inserts are high positive and sharp ground
- SWISS Precision Tool. The milling heads and cutting inserts are manufactured in Switzerland
- The sharp edges create less cutting forces and require less spindle power than pure sintered milling inserts
- The sharp ground cutting inserts are optimized for modern 5-axis milling centers
- The RP Weldon end mills are available from the warehouse in the Ø 16 mm and Ø 20 mm with RP 06, in Ø 25 mm with RP 08 and in Ø 32 mm with RP 10
- All RP tools are provided with coolant holes for internal coolant supply
- The best PVD coatings are available
- The RP cutting inserts are available in HSS and carbide

*while stocks last

Tool will be delivered with holder, all screws and screw-driver, but without indexable inserts.

Rigid roughing tool with a strong insert for turning.

Good cooling increases tool life.

All ALESA indexable inserts are ground in the high ISO standard tolerance classification F.

Tool will be delivered with holder, all screws and screw-driver, but without indexable inserts.

The all purpose turning tool

Indexable insert type K for a controlled chip or as chip-breaker.

The highly positive cutting geometries reduce the cutting forces considerably.

On a holder right: for longitudinal turning use inserts right, for face turning use inserts left. Holder left vice versa.

Tool will be delivered with holder, all screws and screw-driver, but without indexable inserts.

Ideal cutting geometries and coating for stainless and acidproof steels with a high nickel and chrome content.

The perfect tool for profile turning and finishing.

Good cooling increases tool life.

Indexable insert type K for a controlled chip or as chip-breaker.

Tool will be delivered with holder, all screws and screw-driver, but without indexable inserts.

The classical finishing tool.

Good cooling increases tool life.

Indexable insert type K for a controlled chip or as chip-breaker.

The highly positive cutting geometries reduce the cutting forces considerably.

Tool will be delivered with holder, all screws and screw-driver, but without indexable inserts.

Rigid roughing tool with a strong insert for turning.

Indexable insert type K for a controlled chip or as chip-breaker.

The tool for an excellent metal removal rate (cutting depth 16 mm).

Rectangular shoulder (90°) through the full length of cutting edge.

Tool will be delivered with holder, all screws and screw-driver, but without indexable inserts.

The right execution of toolholders for boring need a left hand insert, and vice versa.

Indexable insert type K for a controlled chip or as chip-breaker.

Holes for internal coolant supply guarantee ideal cooling.

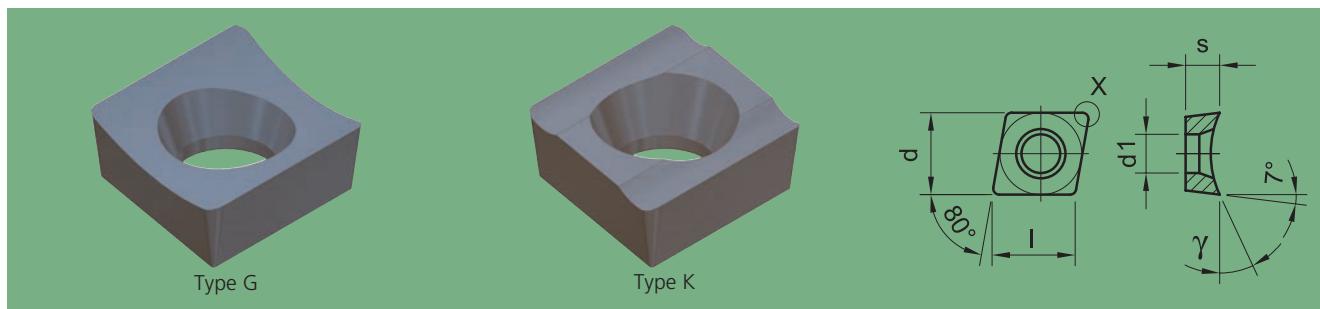

Good cooling increases tool life.

Overview of all indexable inserts see page 106 and following.

ALESA toolholder SM for turning inside

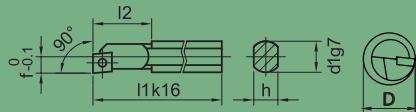

MPFT 04 / 06 - 08

1918

Turning inside

1918.0200

Part No	Type	d1 mm	h mm	l1 mm	l2 mm	f mm	D min	Article	Type	Article	Type	WSP	
1918.0180	S06J SMFPR 04	6	5.5	90	15	3	6	r	1490.0190	M2x4 / 0.4Nm	1492.0200	T 6	MPFT 04
1918.0200	S08J SMFPR 04	8	7.2	100	20	4	8	r	1490.0190	M2x4 / 0.4Nm	1492.0200	T 6	MPFT 04

Tool will be delivered with holder, all screws and screw-driver, but without indexable inserts.

The right execution of toolholders for boring need a left hand insert, and vice versa.

The highly positive cutting geometries reduce the cutting forces considerably.

All ALESA indexable inserts are ground in the high ISO standard tolerance classification F.

Good cooling increases tool life.

Tool will be delivered with holder, all screws and screw-driver, but without indexable inserts.

The right execution of toolholders for boring need a left hand insert, and vice versa.

Holes for internal coolant supply guarantee ideal cooling.

Indexable insert type K for a controlled chip or as chip-breaker.

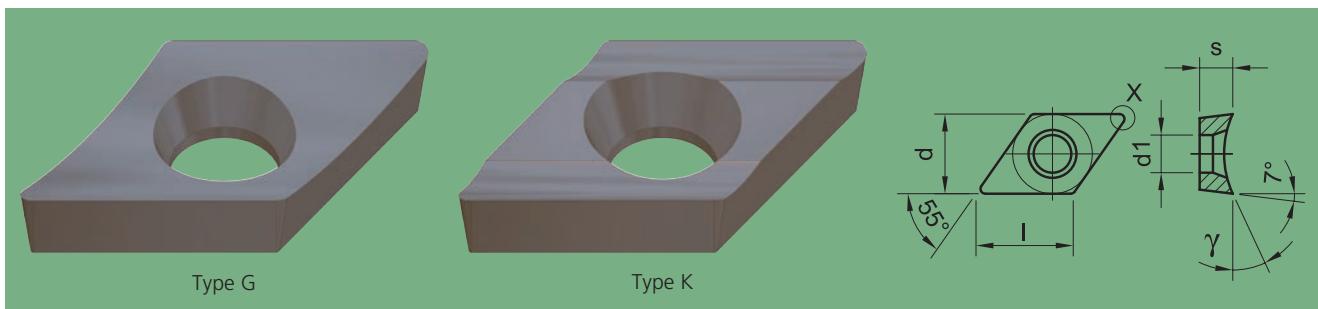

Good cooling increases tool life.

Tool will be delivered with holder, screws and screw-driver, but without parting-off blades.

Exact positioning due to a perfect clamping device.

Correct center height and constant cutting speed for cutting off.

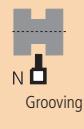

HSS-E is a shock-resistant cutting material ideal for interrupted cuts.

Special tools

Your partner for
customized
system solutions!

Special dimensions

You know ALESA Ltd. as the specialists for highly positive and extremely sharply ground cutting inserts of HSS-E and carbide, and for special tools.

The competence of ALESA Ltd. covers the entire process from design, engineering, selecting the right cutting materials and coatings, including the application technology.

Each standard tool can also be adapted to your individual needs.

HSS tool blanks

According to your drawings and specifications:

Blanks from our main HSS sheet metal camp in Switzerland

- Thickness 0.8 - 6.0 mm
- HSS quality (No. 1.3343) and HSS-E (No. 1.3243 and 1.3247)
- Contour-cut by laser beam
- Raw or flat ground
- Case-hardened and tempered
- Finished ground to thickness
- Suitable, for example, for the manufacturing of flat or circular cutting blades.

We also take over the hardening and tempering of the blanks you have processed.

Sheets in other qualities can also be delivered to us for laser cutting and for possible additional operations.

The blanks that are processed by us are best suited for further processing through wire cutting.

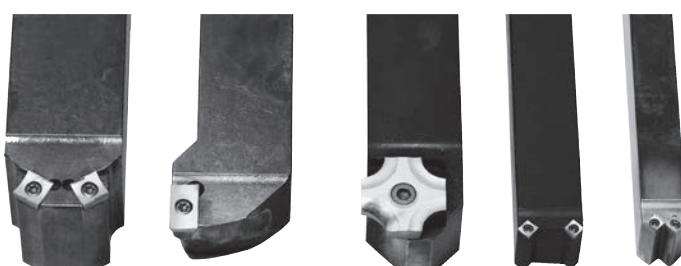

Ask for our non-binding offer.

Special plane tools

Because of the hardness of HSS-E, the cutting inserts sustain the movements during entry and exit as well as uninterrupted cutting.

Through cutting insert technology always the same cutting edge geometry and repeat accuracy of measuring. No regrinding.

Overview coatings

Applied on ALESA indexable inserts

TiN

Hardness 2300 HV 0.05
 Coefficient of friction 0.4
 Max. temperature 600 °C
 Colour gold-yellow

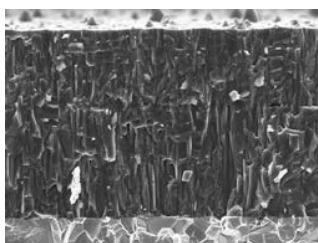

The TiN coating is a universal standard, mainly on HSS tools.

It is a good protection against abrasive and adhesive wear.

Often applied for decorative reasons or optical wear indicator.

TiAlN

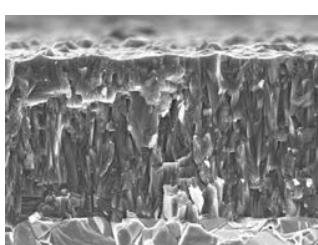

Hardness 3300 HV 0.05
 Coefficient of friction 0.3-0.35
 Max. temperature 900 °C
 Colour violet-grey

The perfect balance of hardness and compressive stress of TiAlN results in a very stable cutting edge. The excellent thermo and chemical consistency allow dry machining. The very high hardness of TiAlN protects against erosion and abrasive wear.

AlCrN

Hardness 3200 HV 0.05
 Coefficient of friction 0.35
 Max. temperature 1100 °C
 Colour light-grey

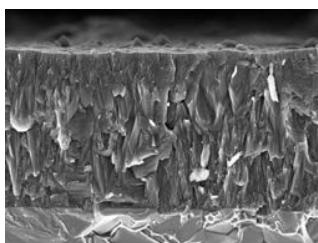

Excellent wear resistance, thermo-shock stability und warm hardness – those are the strength of AlCrN.

It is an all-round coating for cutting tools, stamping, metal forming and die-cast aluminum.

AlCrN-VA

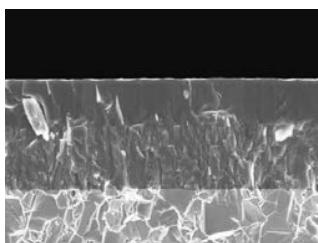

Hardness 3200 HV 0.05
 Coefficient of friction 0.3
 Max. temperature 1100 °C
 Colour light-grey

AlCrN-VA performs with a higher wear resistance, higher oxidation resistance and warm hardness. With AlCrN-VA productivity and quality- improved cutting processes can be achieved even in difficult materials and alloys.

TiNox

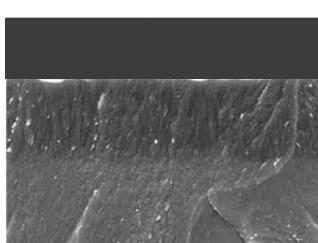

Hardness >3750 HV 0.05
 Coefficient of friction n.a.
 Max. temperature 1100 °C
 Colour bronze

The multilayer PVC coating TiNox combines a strong bonding on carbide with an excellent wear and oxidation resistance. ALESA recommends the combination of suitable carbide substrate qualities, cutting-edge geometry and TiNox for stainless steel, Duplex-, Nickel based- and Titanium-alloys.

TiNox-G

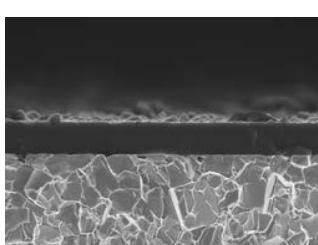

Hardness >3800 HV 0.05
 Coefficient of friction n.a.
 Max. temperature 1100 °C
 Colour bronze

The multi-layer structure AlTiN/TiSiXN is a further development of TiNox. The AlTiN base with a very small crystal structure results in excellent layer adhesion. The top layer out of TiSiXN results in very high hardness and wear resistance. ALESA recommends TiNox-G for fine finishing in cast iron and steel alloys.

DLC-H

Hardness >5000 HV 0.05
 Coefficient of friction 0.15
 Max. temperature 500 °C
 Colour black

Very high wear resistance, excellent coefficient of friction and perfect ply adhesion those are the properties of DLC-H.

This is the top coating for Aluminum and Aluminum alloys up to 12% Silicon, non ferrous metals as Copper, Bronze, Silver, Gold, Platinum as well as GFK and CFK composite, organic materials as wood and paper.

Substrate, geometry and coating selection

for all ALESA TWIST- and DELTA indexable inserts

Application recommendation for substrate, geometry and coating

Based on the material classification and the tensile strength, the suitable ALESA TWIST indexable insert can be selected by means of the 'cloud' graphics below. The substrate and geometry are defined with a 3 digit number (e.g. 431). You'll find the appropriate coating in the graphics headline.

Information about coatings

For carbide tools: PVD-coatings **based on AlCrN** showed best results. Besides the surface hardness of approx. 3'200 HV AlCrN-coatings have an improved application temperature and a good plly adhesion. AlCrN is perfect for material classification 1, 2 & 3.

We recommend AlCrN-VAT for Duplex-materials, Material classification 5 and Cobalt-based alloys.

The **DLC-H** coating is very hard with > 5'000 HV. It is a very smooth coating with a low sticking effect of the chips. It has a very low friction coefficient. As a thin layer coating it maintains the sharp ground cutting edges. This coating is for NON – FERRITIC alloys only, as Copper, Tin, Lead, Silver, Gold, Platinum, Alum-alloys and -cast with up to 12% Silicon, GFK and CFK and organic materials as wood and paper.

Recommended for application with characteristic abrasion und adhesion behaviour.

hm → fz table

Determine the feed per tooth fz by means of the average chip thickness hm

The table shows the feed per tooth fz [mm] to choose for obtaining the required average chip thickness hm.

References and hints for problem solving

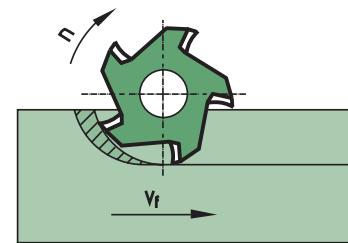

Positioning of the milling tool

favourable

reduced eruption tendency
improved surface finish
longer tool life

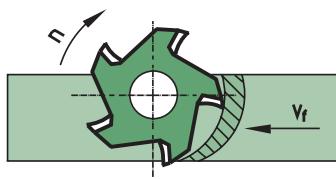

unfavourable

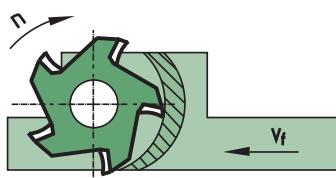

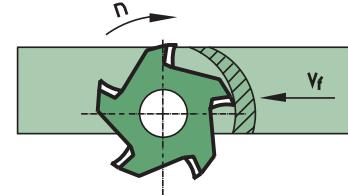

Climb milling vs. conventional milling

Climb milling should always be used unless the machine, clamping system or workpiece is not rigid enough.

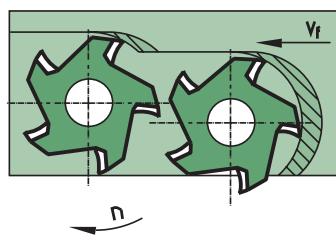

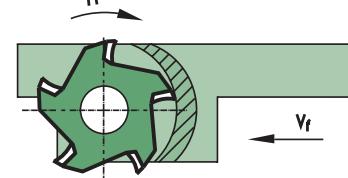

Positioning of milling tool

Where possible the milling cutter should machine tangentially to the workpiece.

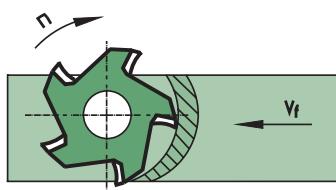

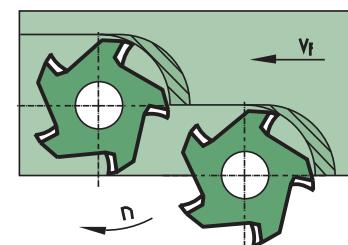

Positioning of workpiece

Where possible to reduce cutting forces the milling cutter should machine tangentially over the complete length of the workpiece.

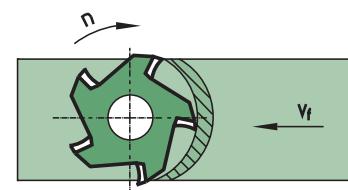

Overlapping

When overlapping extreme caution should be exercised when exiting with the milling cutter (as shown in the left hand sketch).

Size of the milling tool

When face milling the diameter of the milling tool should be 20–30% larger than the width of the workpiece.

Suggested solutions

Problem	Reason	Cutting speed	Feed	Cutting depth	With coolant	Without coolant	Climb milling	Conventional milling	Coating	Improve chip removal	Change positioning of the cutter	Reduce tool overlapping	Improve stability	Cutting edge angle
Excessive flank wear	<ul style="list-style-type: none"> Excessive cutting speed Depth of cut too small Feed too low Incorrect milling method 	↓	↑				■	■

Q	Metal removal rate	[cm³/min]
v_c	Cutting speed	[m/min]
v_f	Feed rate	[mm/min]
Z	No. of teeth	
K	Angle «Kappa»	[°]
Φ	Angle «Phi»	[rad]

General formulas

Cutting speed [m/min] $v_c = \frac{D \cdot \pi \cdot n}{1000}$

Revolution [rpm] $n = \frac{v_c \cdot 1000}{D \cdot \pi}$

Feed rate [mm/min] $v_f = f_z \cdot n \cdot Z$

Feed per tooth [mm] $f_z = \frac{v_f}{n \cdot Z}$

Metal removal rate [cm³/min] $Q = \frac{a_p \cdot a_e \cdot v_f}{1000}$

Circular interpolation (external and internal)

Circular interpolation (external)

Feed rate
(path speed to centre of milling tool)

$$v_f = \left(1 + \frac{D}{D_w}\right) \cdot n \cdot f_z \cdot Z$$

Real cutting depth

$$a_e = \frac{D_a^2 - D_w^2}{4 \cdot (D_w + D)}$$

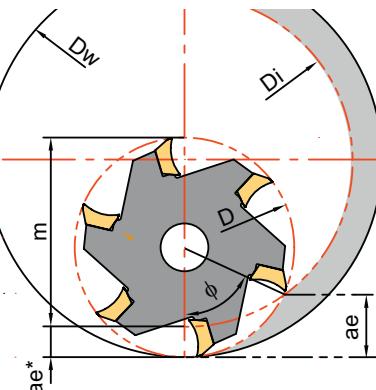

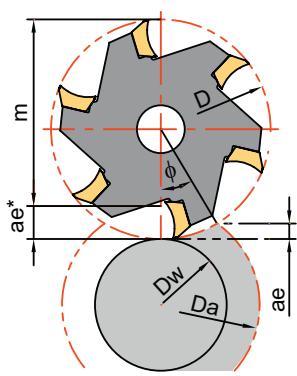

Circular interpolation (internal)

Feed rate
(path speed to centre of milling tool)

$$v_f = \left(1 - \frac{D}{D_w}\right) \cdot n \cdot f_z \cdot Z$$

Real cutting depth

$$a_e = \frac{D_w^2 - D_i^2}{4 \cdot (D_w - D)}$$

The average chip thickness hm and the feed per tooth fz can be calculated by means of the formulas on the following page. Please note that the calculated real cutting depth ae and not the value ae^* must be introduced in the formula.

Formulas and calculations

Minimum feed rate

valid for $a_e \leq 30\%$ of the tool diameter

To remain above an average chip thickness of **hm = 0.01 mm**, the feed rate should remain above the following values:

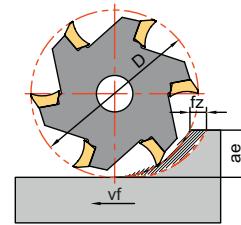

$a_e/D:$	0.01	0.02	0.04	0.06	0.10	0.30
Min.- $f_z:$	0.10	0.07	0.05	0.04	0.03	0.02

Milling cutters and full-side cutters

simplified formula to use up to $a_e/D \leq 30\%$

$$h_m \approx f_z \cdot \sqrt{\frac{a_e}{D}}$$

$$f_z \approx h_m \cdot \sqrt{\frac{D}{a_e}}$$

General formula for hm and fz

with angle of engaged cutting Φ

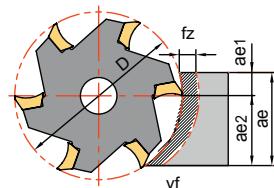

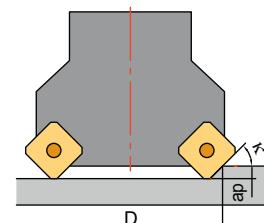

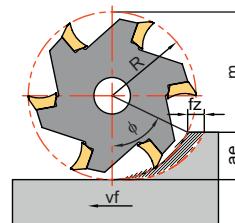

$$\Phi = \arcsin\left(1 - \frac{m}{R}\right) + \arcsin\left(\frac{a_e + m}{R} - 1\right)$$

Average chip thickness

$$h_m = \frac{f_z \cdot a_e}{\Phi \cdot R} \cdot \sin(K)$$

Feed per tooth

$$f_z = \frac{h_m \cdot \Phi \cdot R}{a_e} \cdot \frac{1}{\sin(K)}$$

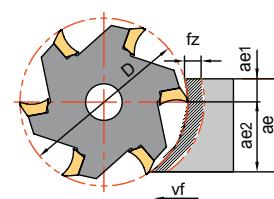

without angle of engaged cutting Φ

Average chip thickness

$$h_m = \frac{f_z \cdot a_e \cdot 360^\circ \cdot \sin(K)}{\pi \cdot D \cdot \left(\arcsin\left(\frac{2 \cdot a_{e1}}{D}\right) + \arcsin\left(\frac{2 \cdot a_{e2}}{D}\right) \right)}$$

Feed per tooth

$$f_z = \frac{h_m \cdot \pi \cdot D \cdot \left(\arcsin\left(\frac{2 \cdot a_{e1}}{D}\right) + \arcsin\left(\frac{2 \cdot a_{e2}}{D}\right) \right)}{\sin(K) \cdot 360^\circ \cdot a_e}$$

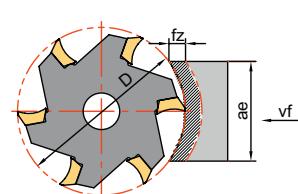

Face milling – above center of workpiece

Average chip thickness

$$h_m = \frac{f_z \cdot a_e \cdot 180^\circ \cdot \sin(K)}{\pi \cdot D \cdot \arcsin\left(\frac{a_e}{D}\right)}$$

Feed per tooth

$$f_z = \frac{h_m \cdot \pi \cdot D \cdot \arcsin\left(\frac{a_e}{D}\right)}{\sin(K) \cdot 180^\circ \cdot a_e}$$

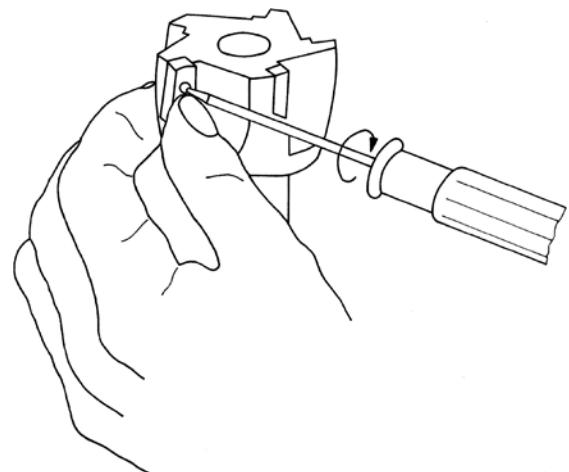

Indexable Inserts

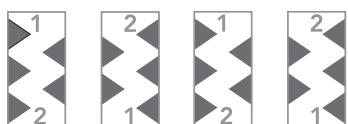

Informationen and instructions

Fitting instructions for inserts

1. Tool rest and positioning surface of inserts and milling head must be cleaned carefully.
2. Inserts must lie absolutely flat.
3. Before tightening the screw, the insert has to be pressed onto the positioning surface of the milling head.
4. Then, the screw has to be fully tightened.
5. Screws must be tightened again according to our torque table after initial milling operation.
To be observed particularly when using screws $\leq M 2,5$ (settling)!

Order of inserts with chip splitting

Order of even number of teeth

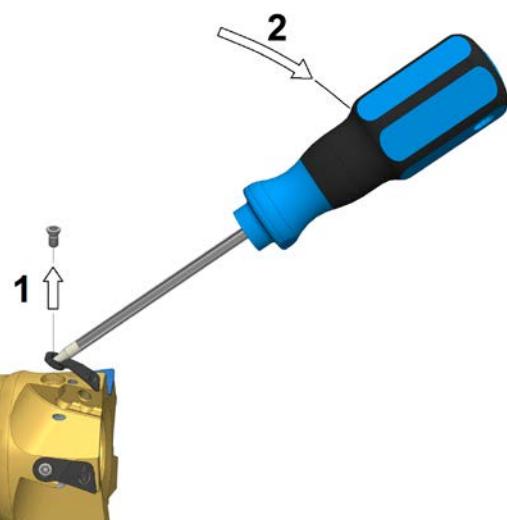

In case of odd number of teeth use indexable insert No 3 once

How to handle the hydroshield on milling head Coolex, No 1340

Removal

1. Loosen the fixing screw (Torx 7IP)
2. Pull out the hydroshield with the screwdriver as shown on the picture.

Assembly

Attention: Line up pin (bottom) at first into the positioning grove
